G-1 VERIFICATION — Old Comment III:75, עם vs 111

Subagent verification, 2026-10-11. Findings, never doctrine.

The question

The sweep's G-1: Old Comment III:75 claims " = עם111 … 111 × 6 = 666" and "עם with ם final adds to 671," but = עם70+40 = 110) 670(. Small exact +1, systematic twice, load-bearing on the 666 equation. Transcription slip or Crowley's?

Work log

- **Hypothesis:** the 1912 first publication (Equinox I:7, "LIBER LEGIS; THE

COMMENT," pp. 387–400a) would settle it — published in Crowley's lifetime under his direction.

- **Method:** located the IA item `oto-equinox-vol-1-no-01-10`

("Equinox Vol 1 No 07.pdf"), downloaded, found the III:75 comment on PDF p. 439 (= printed p. 400a), rendered at 300 dpi, and read the Hebrew glyphs visually at 4–6× zoom — no OCR reliance for the letters.

- **Observation:** the printed Hebrew word is **אעם** (aleph-ayin-mem),

three letters, not the two-letter עם of both web transcriptions. The rightmost glyph matches the aleph in the adjacent " = אה6" exactly; the middle glyph is ayin; the leftmost is a closed final mem.

- **Dead end:** two crop attempts missed the line before landing it —

noted so the next verifier aims at PDF p. 439 directly.

- **Result:** = 1+70+40 = אעם **111** ✓. And "with a ם final" =

 = (mispar gadol ,600)ם+(70)ע+(1)א**671** ✓ — the text explicitly flags the final-mem valuation. 111×6=666 ✓. Every number on the page is arithmetically exact.

Conclusion

(a) What the source shows: the 1912 print reads = אעם111 and אעם (final-mem valued) = 671. Both correct. There is no +1 discrepancy in Crowley's text.

(b) Source verified: *The Equinox*, Vol. I No. 7 (London: Wieland & Co., March 1912), "LIBER LEGIS; THE COMMENT," printed p. 400a — Internet Archive item `oto-equinox-vol-1-no-01-10` (https://archive.org/download/oto-equinox-vol-1-no-01-10/Equinox%20Vol%201%20No%2007.pdf), PDF p. 439, glyphs read visually at zoom. (1912 = public domain, US.)

(c) Assessment: G-1 is dead. Both web transcriptions (tarrdaniel.com, otohungary.org) dropped the small initial aleph, reading אעם as עם — a transcription artifact, exactly like the Yophiel dissolution. What Crowley published is arithmetically coherent: 111, 671 (via flagged mispar gadol), and the load-bearing 666 all verify. Neither error nor breadcrumb — the anomaly never existed outside the transcriptions. (The kolel hypothesis is now unnecessary: the numbers work without it.)

(d) Not verified: Crowley's holograph manuscript of the Old Comment was not consulted — but the 1912 print was set under his direction and is internally self-consistent (the 666 equation *requires* the aleph), so a manuscript check could not resurrect the anomaly.

Note for the ledger: the sweep's standing rule held — "no candidate counts until scan-verified." Scan-verified, candidate dismissed.
