UNITY-vs-WAR TERMS — Hebrew Fallback + Latin Control

PONTIFEX extension: six concepts weighed through two fallbacks, spreads reported

Thelemic date: Sun 2026-10-11 (dies solis), Anno V:xii e.n. — 93.

Ordered by Johnathan; Hebrew arm approved by him, Latin arm added as his control.

Tier: CONSTRUCTED throughout. Findings, never doctrine. The red pen rules.

---

0. ULTRA-VERBOSE WORK LOG

Hypothesis method observation result per step, dead ends included.

Step 1 — Calibration. Hypothesis: the attested table must verify before anything is weighed. Method: import HEBREW and LATIN_ORDINAL from pontifex.tables (never retype), assert =עז77, fail closed on failure. Observation: ` = עז77` on first run. Result: the run may proceed; the script (`weigh_unity_war.py`) re-asserts this every run.

Step 2 — Native-term research. Hypothesis: real dictionaries, not memory, must supply the Japanese/Chinese/Sanskrit words. Method: web dictionary searches (jisho.org/EDICT, Collins, sanskritdictionary.com/Apte). Observation: unity, war, tribe verified cleanly in all three tongues (, , via Apte; 団結/ 統一, 统一/团结 via jisho/Collins). Dead ends: Sanskrit *harmony* (— single weak attestation, kept but flagged WEAK), *bhrātṛtva* and *mānavatā* (standard formations, dictionary pages blocked by 403 in this pass — kept, flagged WEAK, never presented as verified). Result: 18 native terms recorded, 3 flagged WEAK with the flag in the open. Lesson: the native layer is context, not data — the tongues have no table, so these words are weighed by no bank here.

Step 3 — Hebrew renderings. Hypothesis: 2–3 attested renderings per term from reputable lexicons. Method: dictionary searches. Observation: שבט, מלחמה/קרב, אחדות/ איחוד (+biblical מטה), אחווה all solid; הרמוניה confirmed as the loanword in actual use (no native word exists — one source notes this explicitly); התאמה/אנושיות kept as labeled semantic alternatives. Result: 11 Hebrew renderings, each with its source note in the script.

Step 4 — Weighing. Hypothesis: hand-check a few, let the script do the rest. Method: script weighs all 24 rows letter-by-letter, prints the sums, writes `unity-war-values.csv`, checks the sweep's target list (77/93/418/11/32/666/777 + sweep-internal 311). Observation: all hand checks matched (e.g. שבט=300+2+9=311=אחדות; 1+8+4+6+400=419). Dead end #1: I first mis-added BROTHERHOOD as 123 (=מלחמה!) before the script corrected me to 128 — the would-be "brotherhood=war" bridge died in arithmetic, and is recorded here so nobody resurrects it. Dead end #2: TRIBUS=89=UNITY=89 looked like a bridge until the sweep's own anti-finding applied — English and Latin share the ordinal bank (one bank, not two), so it is bank identity, not a bridge. Result: 24 verified values, CSV written.

Step 5 — Latin control. Hypothesis: per John's rationale, if the Hebrew bank is compromised, Hebrew-fallback bridges may be fallback artifacts; a second fallback tests legitimacy. Method: weigh the attested Classical Latin words (unitas, harmonia + concordia, bellum, tribus, humanitas, fraternitas; Lewis & Short standard entries) in the ordinal bank, then compare per concept: bridge in BOTH fallbacks = robust; in ONE = fallback- dependent artifact. Observation: no concept meets in both fallbacks. Result: the control did its job — see §4.

---

1. PER-TERM LEDGER

UNITY

• Native: JP 団結/統一 (jisho.org EDICT; Collins) · ZH 统一/团结 (Collins) · SA aikyam (Apte: "oneness, unity, harmony")

• Hebrew: =אחדות419=איחוד · 29 → spread {419, 29}

• English: UNITY=89 · Latin: UNITAS=84

• Notes: =אחדות419 is one off 418 (ABRAHADABRA) — near-miss, not a hit.

HARMONY

• Native: JP 調和 (Collins) · ZH 和谐 (standard) · SA (WEAK — single attestation)

• Hebrew: =הרמוניה316=התאמה · 451 → spread {316, 451}

• English: HARMONY=94 · Latin: HARMONIA=79, CONCORDIA=82

• Notes: no target contact anywhere.

WAR

• Native: JP 戦争 (jisho, standard) · ZH 战争 (standard) · SA yuddha (Apte: "war, battle, fight")

• Hebrew: =מלחמה123=קרב · 302 → spread {123, 302}

• English: WAR=42 · Latin: BELLUM=65

• Notes: the BROTHERHOOD=123 phantom died in arithmetic (true 128) — recorded, not claimed.

TRIBE

• Native: JP 部族 (jisho, standard) · ZH 部落 (standard) · SA jana (sanskritdictionary.com: "people, tribe," Rigvedic)

• Hebrew: =שבט311=מטה · 54 → spread {311, 54}

• English: TRIBE=54 · Latin: TRIBUS=89

• Notes: =שבט311 collides with sweep-internal QIRA=311 — but QIRA was weighed

in the Hebrew bank, so this is an **in-bank collision**, not a cross-bank bridge. =מטה54 meets English TRIBE=54 — a genuine Hebrew↔ordinal meeting, via the secondary biblical rendering; chance-flagged (§5).

HUMANITY

• Native: JP 人類 (Reverso; standard) · ZH 人类 (standard) · SA (WEAK — standard modern word, classical attestation not re-verified)

• Hebrew: =אנושות763=אנושיות · 773 → spread {763, 773}

• English: HUMANITY=111 · Latin: HUMANITAS=106

• Notes: HUMANITY=111 — 111 is Crowley's א-in-full number (cf. G-1

verification: =אעם111), but 111 is not a sweep target; noted, not claimed.

BROTHERHOOD

• Native: JP 兄弟愛 (LingQ/EDICT: brotherly love) · ZH 兄弟情谊/手足情谊 · SA (WEAK — standard MW formation, not re-verified this pass)

- Hebrew: =אחווה26 → spread {26}
- English: BROTHERHOOD=128 · Latin: FRATERNITAS=131
- Notes: no target contact anywhere.

---

2. LATIN CONTROL — COMPARISON

Concept	Hebrew spread	Latin value(s)	Verdict
unity	{419, 29}	84	no meeting — fallback-dependent (nothing shared)
harmony	{316, 451}	79, 82	no meeting
war	{123, 302}	65	no meeting
tribe	{311, 54}	89	no meeting in Latin; =מטה54 meets the *ordinal bank* (English TRIBE=54) — one-fallback meeting, chance-flagged
humanity	{763, 773}	106	no meeting
brotherhood	{26}	131	no meeting

Control result: ZERO concepts bridge in both fallbacks. Every number in this extension is fallback-dependent. Per John's rationale for the control, that is the finding: had any bridge appeared in both, it would have earned the "robust" flag; none did.

Bank-identity correction (sweep's own anti-finding, honored): TRIBUS=89=UNITY=89 is one bank (English≡Latin ordinal), not a bridge.

---

3. CHANCE ANALYSIS (METHOD.md §5)

24 weighings × 8 targets: §5 says coincidences are guaranteed, not evidence. Observed: one in-bank collision (=שבט311=QIRA), one cross-bank meeting (=מטה54=TRIBE, via secondary rendering), one near-miss (=אחדות419 vs 418). This is *within* chance expectation — the honest reading is noise, and the report so states. Nothing here is load-bearing.

4. STANDING NOTES FOR THE RED PEN

1. Translation is two layers of choice (native term × Hebrew rendering); every value is CONSTRUCTED. The spreads are the finding. 2. Three native terms carry WEAK verification flags (SA harmony, humanity, brotherhood) — strengthening them needs dictionary pages this environment could not reach (one 403). 3. The Latin arm used the ordinal bank per the brief; Agrippa's Latin was not weighed (out of scope). 4. No bridge was declared. Per the brief: report spreads only.
